

Most protein kinases belong to a single superfamily of enzymes whose catalytic domains are related in sequence and structure. The main diagram illustrates the similarity between the protein sequences of these catalytic domains. Each kinase is at the tip of a branch, and the similarity between various kinases is inversely related to the distance between their positions on the tree diagram. Most kinases fall into small families of highly related sequences, and most

The inset diagram shows trees for seven atypical protein kinase families. These have verified or strongly predicted kinase activity, but have little or no sequence similar members of the protein kinase superfamily. A further eight atypical protein kinases in six families of one or two genes are not shown.
